# NUMBER OF FARMS

## By States, 1910-56, Revised Estimates

This publication presents a series of annual estimates of number of farms by States for the period 1910-56. Estimates for 1910-52 have been used within the Department for some time; those for 1951-56 are on a revised Census level. These data now constitute the official Department of Agriculture series on number of farms. National and geographic division estimates are the sums for individual States.

## DESCRIPTION OF SERIES AND ESTIMATING PROCEDURES

The Agricultural Estimates Division prepares annual estimates of the number of farms for use in its regular work. These estimates are based mainly on indications of change shown by its larger acreage and livestock surveys, by annual assessors' censuses in a number of States, by land assessment records in certain States, by ASC data, and other miscellaneous sources of check data.

This series of annual estimates of number of farms has been revised following the Census of Agriculture taken every 5 years. Data available to indicate the completeness of the Census of Agriculture vary State by State, but, with few exceptions, a larger number of farms has been adopted than enumerated by the Census in order to allow for some incompleteness. This incompleteness has long been recognized by the Census Bureau and other agencies.

In evaluating the census data prior to 1950, the practice was to accept the census number of farms as a minimum and adopt varying degress of incompleteness as indicated by check data on a State, and in many instances, a county evaluation basis. The Bureau of the Census, as a part of the 1950 and 1954 Censuses of Agriculture, undertook detailed special surveys to give estimates of the completeness of coverage and to provide measures for determining sampling errors for a few important items on a regional and national basis. In making revisions in its series for 1950 and 1954, Agricultural Estimates relied heavily upon the Census Bureau quality check information. The official estimate of total number of farms for the United States for 1954 was set at the level indicated by the results of the Census quality check in consultation with representatives of the Bureau of the Census and the Division of Statistical Standards, Bureau of the Budget. State estimates were then prepared which added to this total taking into account the various indications for each State.

Trends for intercensal years are established from a wide variety of information as indicated heretofore. State Statisticians have these local data available when they attack the problem of estimating changes in number of farms. Estimates prepared by the individual State Statisticians are submitted to Washington for review by representatives of the Crop Reporting Board. Trends are considered by geographic regions and a careful appraisal is made on a State-by-State basis. An attempt is made to conform to the general economic trend and to generally accepted situations within States.

Beginning with 1950 estimates, the new Census Bureau definition of a farm (used by Census in 1950 and 1954) was adopted. Changes in definition of a

farm between the earlier and the more recent censuses are not taken up here. Detailed descriptions are given in introductory volumes of each Census of Agriculture.

Census benchmark data are collected as of different dates, hence there has been some question as to which dates are applicable to this series of estimates. Actually, it is believed that the date of enumeration has little effect on the number of farms. For all practical purposes, then, the series represents the number of farms in operation for the year shown.

USES

A series of annual estimates of number of farms has a wide range of uses. They are of utmost importance in preparing estimates of many agricultural items, for example, estimates of livestock and poultry numbers and number of family and hired workers on farms. Another important use is in the conversion of aggregates of many agricultural statistics to a per farm basis. Most statisticians and economists in the field of agriculture use estimates of number of farms. Agricultural policy studies and much agricultural legislation require the use of estimates of number of farms.

Those using the series should remember that it represents a count of all farms, large and small, including part-time farms as well as strictly commercial enterprises.

The following series on number of farms is presented with the knowledge that the accuracy of the estimates cannot be measured with precision. Although the estimates are subject to some error, it is not believed that such error is large enough to impair the usefulness of the series to those needing annual estimates of number of farms.

Number of Farms, by States, 1910-56

| State and division | 1910 | 1911 | 1912 | 1913 | 1914 | 1915 | 1916 |
